WebSpy Improves Reporting Ability With Latest Software Release

WebSpy Users to Enjoy Improved Reporting and Usability With WebSpy Reporter 3.1

AMSTERDAM, JULY 3, 2000 -WebSpy Ltd today announced the release of WebSpy Reporter 3.1 with support for the public beta version of Microsoft Corp.'s Internet Security and Acceleration Server (ISA) Server 2000. The latest release of WebSpy boasts a dramatically improved reporting engine – giving the software a competitive edge over its other competitors in the small to medium enterprise market.

Over the past six months, WebSpy Ltd has investigated the reporting needs of small to medium enterprises and developed its new reporting engine based on the requirements of this market segment. Summary level analysis combined with the ability to drill down into the data give WebSpy a competitive edge over applications that cannot interrogate data as intensively.

"The latest version of WebSpy has the best user interface for reporting in the field" Says Jack Andrys, CEO of WebSpy Ltd, "Reporter 3.1 is well suited and priced for the current SME market. WebSpy is excited with its support of ISA Server and is looking to build on this relationship in the future."

ISA Server 2000, Microsoft's new enterprise firewall and Web cache server, is designed to help organizations protect, accelerate and control their network access. To complement the secure, fast Internet connectivity offered by ISA Server, WebSpy will offer its advanced reporting and analysis functionality to organizations implementing the Microsoft solution.

"We are very excited with WebSpy's support of ISA Server 2000,". said Nevet Basker, Microsoft's business development manager for the product. "ISA Server 2000 offers IT managers superior control over their company's Internet access, and a tool like WebSpy will offer them significant Internet usage reporting advantages."

WebSpy is looking forward to increasing sales with the release of WebSpy Reporter 3.1. The company has been expanding its distribution channel for the WebSpy product range worldwide and, buoyed by the continuing appointment of qualified partners, is expecting to further increase its market share with this release.

About ISA Server

Microsoft's Internet Security and Acceleration Server 2000 (ISA Server) is an enterprise firewall and Web cache server that enables IT administrators for businesses of all sizes to provide controlled, secure and fast Internet access for their organization. Building on the security and manageability of the Microsoft Windows 2000 platform, ISA Server provides a sophisticated multilevel enterprise firewall and a high-performance Web cache to control, secure and accelerate business on the Internet. ISA Server 2000 is the newest addition to the Microsoft Windows DNA 2000 platform, geared to empower companies of any size to Internet-enable their businesses and to allow developers to build products for the next generation of services that will be available on the Web. For more information on ISA Server 2000, or to download a beta version of the product, go to <http://www.microsoft.com/ISAServer/>.

About WebSpy Reporter 3.1
